

```
"""Sensor reading data structure.
```

```
This module is owned by another contributor. It is reproduced here as a
minimal stub – matching the attribute interface described in the task
(`sensor_id`, `value`, `unit`, `timestamp`) – purely so that
`src/alerts.py` and its tests can run standalone. Replace with the real
implementation when integrating.
```

```
"""

from datetime import datetime
```

```
@dataclass
```

```
class SensorReading:
```

```
    """A single reading reported by a sensor.
```

```
    Attributes:
```

```
        sensor_id: Unique identifier of the sensor that produced the reading.
```

```
        value: The measured numeric value.
```

```
        unit: The unit of measurement (e.g. "C", "psi", "RPM").
```

```
        timestamp: When the reading was taken.
```

```
    """
